

## Commissioning Additional Research

### A - Extension of existing studies

1. For each of the studies, what extensions would you suggest in terms of: (I) production systems, (II) ecological and socioeconomic context, (III) geographies, (IV) positive and negative externalities.

### B - New studies – sectoral approach

1. Which agricultural commodities would you suggest commissioning in order to build up a strong evidence base for the wider TEEBAgFood work stream, & why?  
2. Which case studies and production systems would best support this work?

### C - New studies – non-sectoral approach

What kind of analysis is needed to convince policy makers and corporations of the need to internalize externalities in agricultural production? Would your starting point be a specific group of externalities (e.g. health impacts)?  
Would you look instead to a specific group of production systems?  
Or would you look to a specific scale of analysis (e.g. field, farm, landscape)? Explain your choice.
