

Paris Workshop, 9th-10th May

Panel on TEEB-Agri-Food's Proposed Valuation Framework

Pavan Sukhdev

UNEP Goodwill Ambassador
& Special Adviser - TEEBAgriFood

Will big investors ever filter their debt and equity purchases through a 'sustainability' lens?

Will big investors ever filter their debt and equity purchases through a 'sustainability' lens?

- Global SRI/ESG rated assets went up 61% in just two years, from USD 13.3 trillion (2012) to USD 21.4 trillion (2014)

Figure: Proportion of Global SRI Assets by Region

Table: Growth of SRI Assets by Region 2012–2014

USD Million	2012	2014
Europe	\$8,758	\$13,608
United States	\$3,740	\$6,572
Canada	\$589	\$945
Australia/NZ	\$134	\$180
Asia	\$40	\$53
Total	\$13,261	\$21,358

Will developing countries ever develop policy responses to agri-chemical toxins?

Will developing countries ever develop policy responses to agri-chemical toxins?

Sri Lanka has a 3-Year Plan
For a “toxin-free” nation and
has already banned Glyphosates

Will it ever be possible to quantify the public costs of health damage from agri-chemicals?

Will it ever be possible to quantify the public costs of health damage from agri-chemicals?

HEALTH EFFECTS FROM ENDOCRINE DISRUPTING CHEMICALS COST THE EU €157B EACH YEAR.

This is the tip of the iceberg: Costs may be as high as €270B.

€157B Cost by Health Effect

SOME EDC-RELATED HEALTH OUTCOMES NOT INCLUDED:

- Breast Cancer
- Prostate Cancer
- Immune Disorders
- Female Reproductive Disorders
- Liver Cancer
- Parkinson's Disease
- Osteoporosis
- Endometriosis
- Thyroid Disorders

€157B Cost by EDC Type

SOME EDCs NOT INCLUDED:

- Atrazine
- 2, 4-D
- Styrene
- Triclosan
- Nonylphenol
- Polycyclic Aromatic Hydrocarbons
- Bisphenol S
- Cadmium
- Arsenic
- Ethylene glycol

Endocrine Disrupting Chemicals (EDCs) interfere with hormone action to cause adverse health effects in people.

“THE TIP OF THE ICEBERG”

The data shown to the left are based on fewer than 5% of likely EDCs. Many EDC health conditions were not included in this study because key data are lacking. Other health outcomes will be the focus of future research.

Why have one universal valuation framework for 'TEEBAgriFood' ?

Comparable questions ...

- Why have one framework for ecosystem services? (CICES)
- Why have one framework for corporate financial accounts? (IFRS)
- Generally why not just encourage *laissez-faire*, creative licence, multiple lexicons, numerous black boxes, cherry-picked perspectives?

Benefits of one Universal Framework...

- Checklist for completeness & materiality of impacts and dependencies
- Defined Value Chain Boundaries for evaluation
- Defined Choices of Scale and Scope for evaluation
- Comparability across alternative systems
- Comparability across policy scenarios
- Comparability across alternative agri-food products

Applications of a Universal “Valuation Framework”

(i) Business Analysis

Product X
vs
Product Y

(ii) Typology Comparison

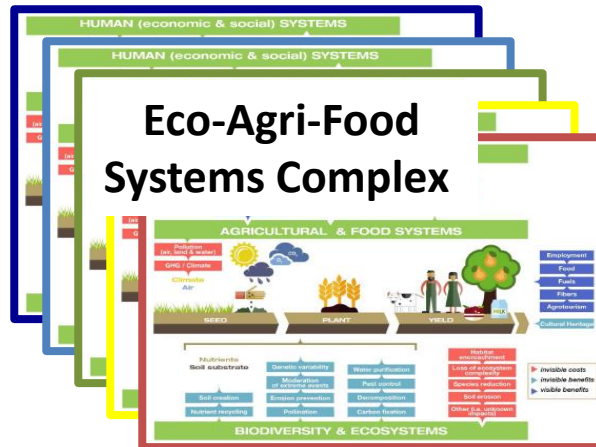

System A
vs
System B

(iii) Policy Evaluation

Policy Scenario 1
vs
Policy Scenario 2

(iii) National Accounting

Unadjusted GDP
vs
Environmentally Adjusted GDP

Thank You !

and

Over to YOU!

Pavan Sukhdev

& CEO- GIST Advisory

Introduction to TEEBAgriFood valuation framework

Kavita Sharma

9th May, 2016

Introduction/ context setting

- Mission statement – *the economic environment in which farmers and agricultural policy-makers operate today is distorted by significant **externalities**, both **negative and positive**. Indeed, most of the largest **impacts on the health of humans, ecosystems, agricultural lands, waters, and seas** arising from various different types of agricultural and food systems, are **economically invisible** and do not get the attention they deserve from decision makers. There is therefore a need to evaluate all significant externalities of eco-agri-food systems, to **better inform decision-makers** in governments, businesses, and farms. Furthermore, there is a need to **evaluate the eco-agri-food systems complex as a whole**, and not as a set of silos.*
- Recognize the role of agriculture in global economy, gender, culture, poverty reduction, and in environmental degradation (positive and negative flows)
 - 1 in 3 (economically active labor force employed)
 - Small holder farms represent over 475 million of the worlds' 570 million farms
 - 80% of new agricultural lands replaced tropical forests
 - World's largest user of antibiotics (70%)
 - Longer value chains
- "Farm to flush": entire value chain, so that above externalities AND consumption issues can also be included

Guiding Principles, Key Elements

Framework Principles

- Holistic View: Yields, employment, health, climate, biodiversity, ESS
- Anthropocentric: Human well-being
- Plurality of values: social, and resilience values (Development)
 - Recognizing all capitals: Natural, physical, social, and human
- Applicability to different types of Farming Systems and Practices

Framework Elements

- Visible and invisible flows from (and into) capital stocks
 - Accounted Economic flows (GDP components – SNA)
 - Unaccounted Economic flows (environmental and health externalities)
 - Social Values, Risks and Uncertainties
- Entire Value Chain
- Spatial Scale and Scope of Evaluation

TEEB AgriFood – Draft Valuation Framework

Value-Chain Stages	Production			Processing and Distribution			Consumption	
	Landscape	Infrastructure and Manufacturing	Farm	Wholesale	Food and Beverage	Retail	Industry/ Household/ Hospitality	Waste
Visible and Invisible flows								
Captured by System of National Accounts (SNA) (Profits, Wages, Taxes net of Subsidies, etc.)								
Provisioning (Materials, Energy, etc.)								
Regulation and maintenance (Soil, Water, Habitat for biodiversity, etc.)								
Cultural (Heritage, Recreation, etc.)								
Health (Nutrition, Diseases, Antibiotic resistance, etc.)								
Pollution (Nitrates, Pesticides, Heavy metals, etc.)								
Emissions (CO ₂ , CH ₄ , etc.)								
Social values (Food security, Gender equality, etc.)								
Risks and uncertainties (Resilience, Health, etc.)								

Way forward

- Framework in Foundations – looking at how comprehensive this is?
- Missing dimensions – ethical issues
- Zooming in (X and Y axis)
- Intermediate goods
- Measurement – Best practices etc., particularly for resilience, and risk
- Evidence of applications
- ...

TEEBAgriFood Valuation Framework

Farm
Sustainability
Assessment Tool

Dr Harpinder Sandhu, Flinders University, Australia.

Harpinder.Sandhu@flinders.edu.au

Externalities Assessment of American Farms

- **Production value:**
- **Environmental benefits:** Water regulation, Carbon sequestration by soil and vegetation, Nitrogen fixation, Nutrient cycling, Soil erosion control, Biological control of pests/diseases.
- **Environmental costs:** Green house gas emissions, External costs of pesticides and fertiliser
- **Social benefits:** Farm employment, Recreation, Education.

Benefit and costs associated with different farm types (\$/acre/year)

	Corn/Soy	Dairy	Diversified
Production value – Corn	884	8178	2015
Production value – Soybean	690		
Environmental benefits	89	193	172
Social benefits	134	494	650
Environmental cost	219	599	153
Net	1578	8266	2684

Corn \$/bu

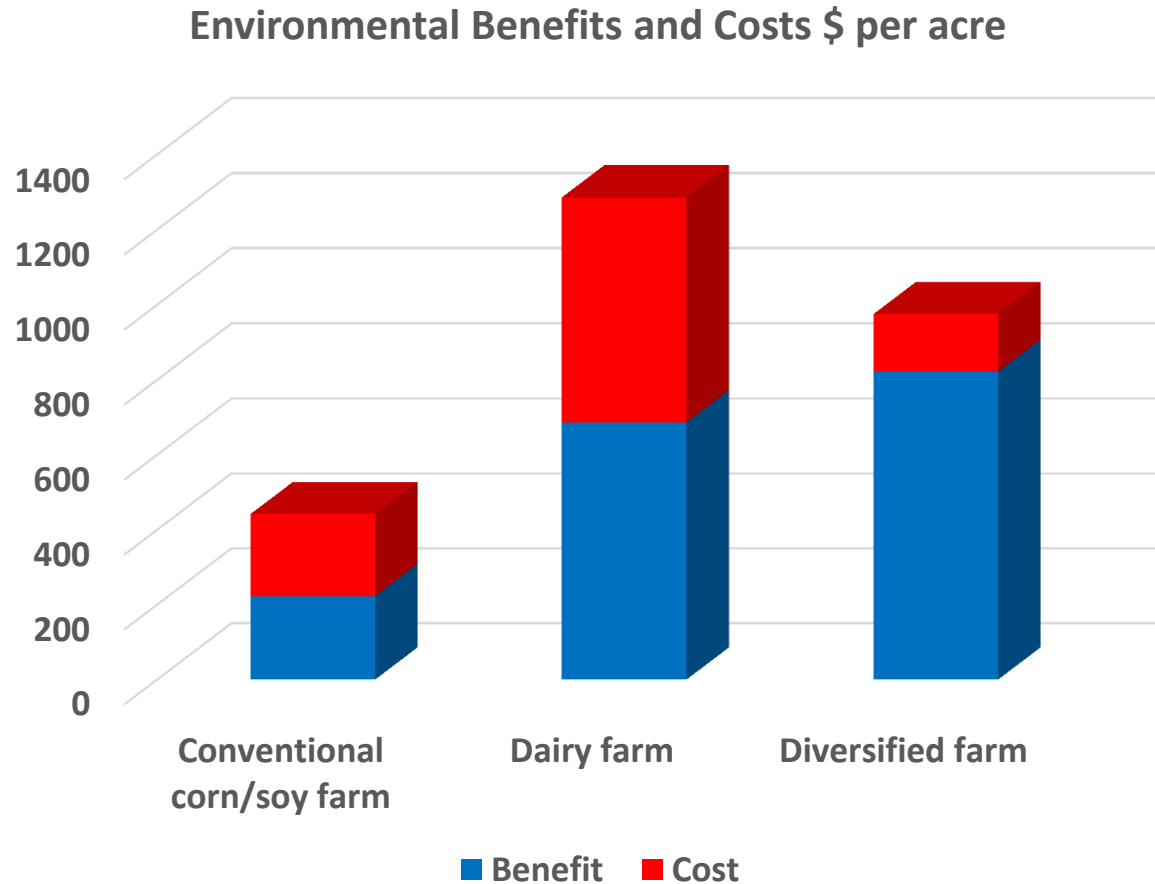

Milk \$/gallon

Beef \$/lb

Comparison of three farming systems

Way forward

- How this unified framework should be adopted for valuation of agriculture/farming systems worldwide?
- How to involve current agriculture R&D so that they can also use this framework to assess different systems more holistically and assess all externalities?
- Corporate involvement is also required as stakeholders may invest in organisations that are more transparent in sharing information and are moving towards minimising their impacts on natural and social resources in value addition/distribution/consumption of food.

Natural Capital Impacts in Agriculture

SUPPORTING BETTER BUSINESS DECISION-MAKING

Impact category	Valuation method	Unit value used (USD 2012)
Atmosphere GHG emissions (including deforestation and managed organic soils) Ammonia emissions	Social cost of carbon (based on a range of approaches, most importantly damage costs/defensive expenditure)	113 \$/tCO ₂ e (globally, no benefit transfer needed)
Water Water quality contamination eutrophication	113 \$/tCO ₂ e (globally, no benefit transfer needed)	5.36 \$/ha (derived from USD 103 million for total ammonia emissions costs from UK agriculture with BT to other countries with correction for N inputs and agricultural areas)
Water use Water scarcity	16.33\$/ha for N eutrophication (based on 0.286\$/kgN leached in UK, correction for N input and output levels and agricultural areas in each country, and BT)	84.15\$/ha for P eutrophication (based on 12.32\$/kg P leached, correction for P input and output levels and agricultural areas in each country and BT)
Soil Soil erosion	1.83\$/ha for nitrate contamination (derived from USD 35.2 million, total nitrate pollution costs from agriculture in the UK, BT to other countries with correction for N inputs and agricultural areas)	40.42\$/ha (UK) and 0.78\$/ha (Thailand) for pesticide contamination (total 264 million in UK, 14.6 million Thailand, corrected for toxicity levels, area, BT)
Land occupation ecosystem serv	0.15\$/m ² (UK) plus BT	0-18.85\$/m ² (based on the scarcity function from USA and national water scarcity levels)
Biodiversity loss (pesticides, N)	21.54\$/ton soil lost from water erosion, 27.38\$/t for wind erosion US values plus BT, plus per ha soil erosion levels from 48 countries and regional averages derived from them, corrected for soil erosion potential of different cultures)	Average 6.11\$/ha forest lost (based on 14 country estimates and regional BT)
Fisheries overf	5.46\$/ha for N eutrophication (based on 0.024\$/kgN applied in UK, correction for N inputs, area and BT)	4.76\$/ha for P eutrophication (based on 0.263\$/kgP applied in UK, correction for P inputs, area and BT)
Pollinator loss Insect	4.21\$/ha (UK) and 1.89\$/ha (Thailand) for pesticide impacts on biodiversity (total 27.5 million in UK, 35.5 million Thailand, corrected for toxicity levels, area, BT)	Global estimates for the total fishery sector from the literature, scaled by wastage shares (18+ only)
Loss of livelihoods 18+ only	Global estimates from the literature, scaled by wastage shares	
Pesticide poison of age 18+ on	8.54*10 ⁻⁸ (OECD) and 1.25*10 ⁻⁷ (Non-OECD) \$/cap/yr soil lost from water erosion (no BT needed)	9.67*10 ⁻⁸ (OECD) and 9.93*10 ⁻⁸ (Non-OECD) \$/cap/yr toxicity level (no BT needed)
Conflict (for ag	0.34\$/ha (UK) and 22.75\$/ha (Thailand) for pesticide contamination (total 2.2 million in UK, 4.06 million Thailand, corrected for toxicity levels, area, BT)	3.21*10 ⁻⁷ \$/cap/yr soil lost from water erosion (based on the 10 conflict countries in the period 2005-8, no BT needed)

& more

Results

Farming – wholesale level

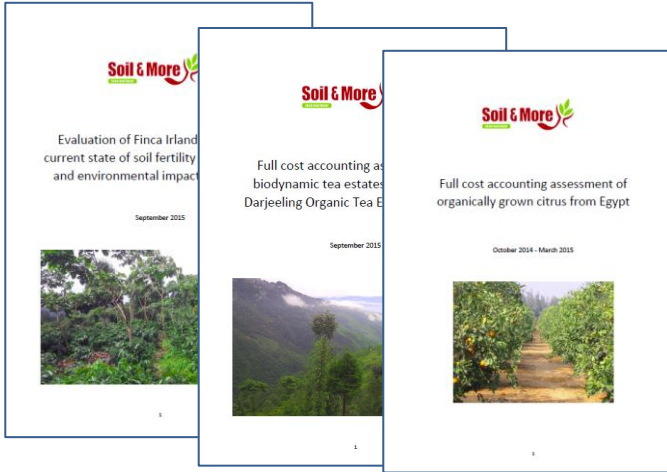

FAO indicators	Reporting summary

Good soil structure means low leakage loss

Bad soil structure means high leakage loss

DISCOVER THE TRUE BENEFITS OF ORGANIC!

Don't we all realize that many hidden environmental and social costs are not reflected in the price of so-called 'cheaper' conventional food? But how high are these costs really? Wouldn't it be great if we were able to put a monetary value on soil degradation, water pollution, loss of biodiversity, climate change? This is exactly what a growing group of scientists, economists, policymakers is trying to achieve.

Nature & More is now ready to provide you with true cost transparency on a selection of our products. The published true cost values are based on calculation models provided by the Food and Agriculture Organization of the United Nations. Obviously far from complete, certainly way too conservative, but a start! First cost comparisons confirm: Organic is not too expensive, conventional is too cheap. Help us spread the news!

Find out
At natureandmore.com you can now calculate the True Cost of Food for everyday products. Have a look and convince yourself that choosing organic is a choice for the future. Spread the news and share the Nature & More True Cost Flower!

LIVELIHOODS

currently not available

HEALTH

currently not available

CLIMATE

Conventional cost: € 514
Organic cost: € 2.542
Organic benefit for society: € 692

BIO-DIVERSITY

currently not available

SOIL

Conventional cost: € 1169
Organic benefit: € 294
Organic benefit for society: € 1417

WATER

Conventional cost: € 752
Organic cost: € 488
Organic benefit for society: € 268

COST COMPARISON PER HECTARE AND YEAR

Learnings

- We have more data/in common than we think
- Social/health remains tricky, especially on product level
- System/time approach is necessary to fully capitalize/account for benefits of e.g. crop rotation vs on-time peak productivity
- Define common framework, allowing flexibility to customize for local circumstances

**Your partner for sustainable
development in agriculture:**

- Soil fertility
- Footprinting
- Sustainability assessment

The Peril of being short-sighted in agriculture – Need for TEEBAg food framework

Haripriya Gundimeda

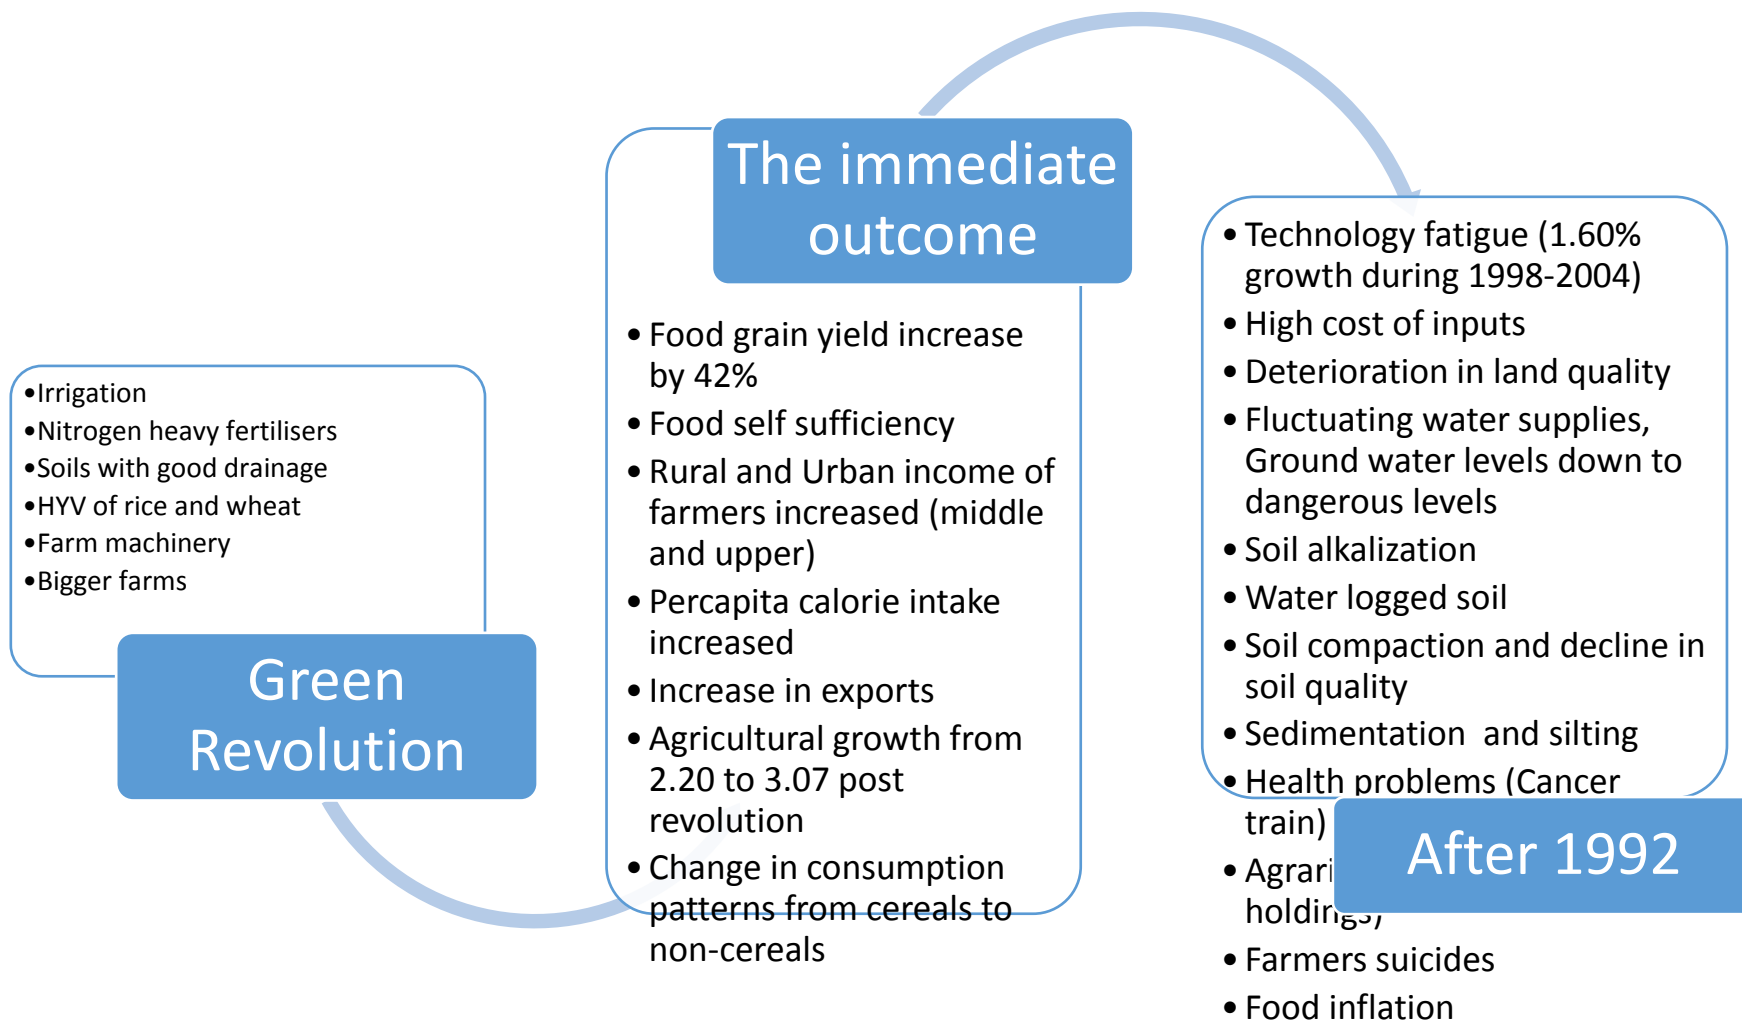

Professor

Department of Humanities and Social Sciences

Indian Institute of Technology Bombay

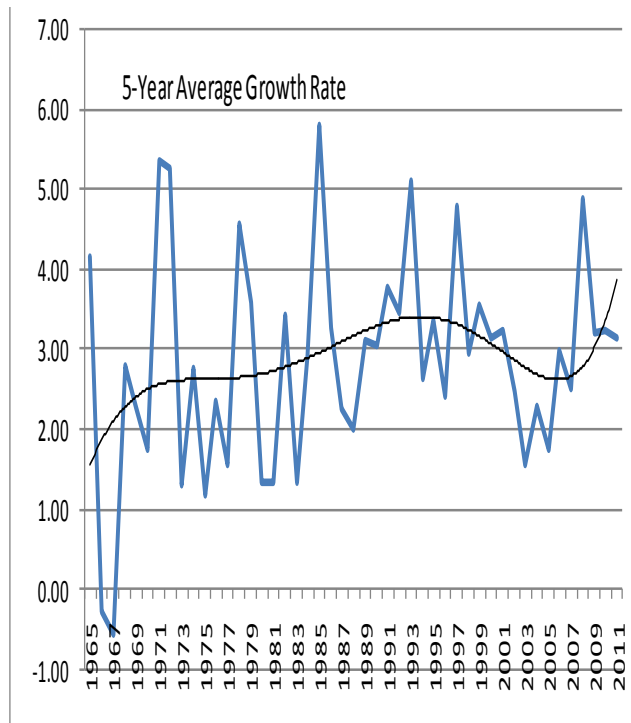

Dangers of non-recognition

Non-recognition leads to short-sighted policies

Deciphering Growth

11th plan steering Group

- Public investment
 - Private Investment
 - Technology
 - Diversification
 - Fertilisers
-
- The only reason for growth in agriculture during 1997-2004 is due to credit growth

Agriculture from national accounting

- Growing of field crops, fruits, nuts, seeds and vegetables
- Management of tea, coffee and rubber plantations
- Agricultural and horticultural services
- Ancillary activities of cultivators, transportation of produce to primary markets and
- Activities yielding rental income from farm buildings and farm machinery and interest on agricultural loans

GM crops for food security – is it a good policy stand?

- Domination by small (1 to 2 ha) and marginal farmers (0.01 to 1ha) accounting for more than 80% of total farm hhs.
- The share in area is around 44%
- 121 million agricultural holdings (census, 2001) of which 99 million were small and marginal farmers
- BT cotton spread to over 85% of the cotton area covering 9.4 mha in 2010-11 since its introduction in 2002. However the cotton production only increased by 2% after 2004.
- The hidden costs – increased irrigation, higher cost of inputs, new pests, secondary pests, monopolistic control over seed markets, Health problems..
- Resistance from Locals against introduction
- Several livelihoods lost and increase in farmers suicides
- Credit and indebtedness

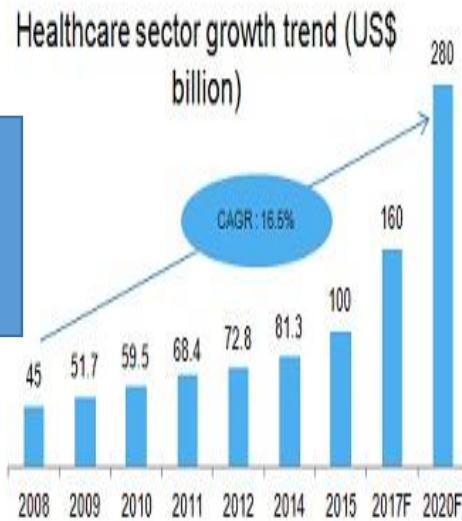

Unpacking agrifood at macro level

- Value added by agriculture in 2002 – 38,91,383 million Rupees (15% of GDP)
- 55% workers employed
- Extent of subsidies - 3,47,840 Million Rupees (9% of value added)
- Fertilisers (39.7%)
- Electricity (18.5%)
- Irrigation (39.3%)
- Others (2.4%)

- Cost of Land reclamation (1.4% of subsidy)
- Replacement cost of soil nutrients (77% of subsidy)
- Sedimentation (29% of subsidy)
